

Features

- Compliant with IEEE 802.3ab/ Gigabit Ethernet
- Compliant with SFP MSA specifications.
- 1000BASE-T operation in host system with SerDes interface
- Compliant with industry standard RFT electrical connector and cage
- EEPROM with serial ID functionality
- Internal PHY IC via 2-wire serial interface
- Hot-pluggable SFP footprint
- 3.3V single power supply
- Compliant with RoHS

Applications

- Gigabit Ethernet over copper
- Switch to switch interface
- Switched backplane applications
- File server interface

Performance

- OP6C-TX1-00-C2 data link up to 100 m on standard CAT 5 UTP

LOS Output Voltage -Low	V_{LOSLL}	0	---	0.8	V	2

Notes:

1. Internally AC coupled and terminated to 100-Ohm differential load.
2. Pull up to V_{CC} with a 4.7K – 10K Ohm resistor on host Board
3. Internally AC coupled, but requires a 100-Ohm differential termination at MAC side.
4. These are unfiltered 20%~80% values

Notes:

- 1) TX Fault is not supported and tied to ground within the module.
- 2) TX disable is an input that is used to reset the chip of Gigabit Ethernet PHY inside the copper SFP. It is pulled up within the module with a 4.7 – 10 K Ω resistor.

Low (0 – 0.8V):	PHY IC on
(>0.8, < 2.0V):	Undefined
High (2.0 – 3.465V):	PHY IC Disabled
Open:	PHY IC Disabled
- 3) These are the module definition pins. They should be pulled up with a 4.7K – 10K Ω resistor on the host board. The pull-up voltage shall be VccT or VccR. MOD-DEF 0 is grounded in the module to indicate that the module is present. MOD-DEF 1 and MOD-DEF 2 are the clock and data lines of the two-wire serial interface, respectively.
- 4) LOS (Loss of Signal) is not available and tied to ground within the module.
- 5) VeeR and VeeT are internally connected within the copper SFP.
- 6) RD+ and RD- are the received differential outputs, and they are AC-coupled 100~ differential lines that should be terminated with 100~ (differential) at user's SERDES. The AC coupling is done inside the copper SFP and thus not required on the host board. The differential voltage swing will be between 250mV and 625 mV, while properly terminated.
- 7) VccR and VccT are the receiver and transmitter power supplies, and they are internally connected within the copper SFP. The power rail is defined as 3.3V \pm 5% at the SFP connector pin.
- 8) TD+ and TD- are the transmitted differential inputs, and they are terminated with 100 Ω differential load inside the module. The AC coupling is done inside the module, and thus not required on the host board.

OP6C-TX1-00-C2 EEPROM Serial ID Information

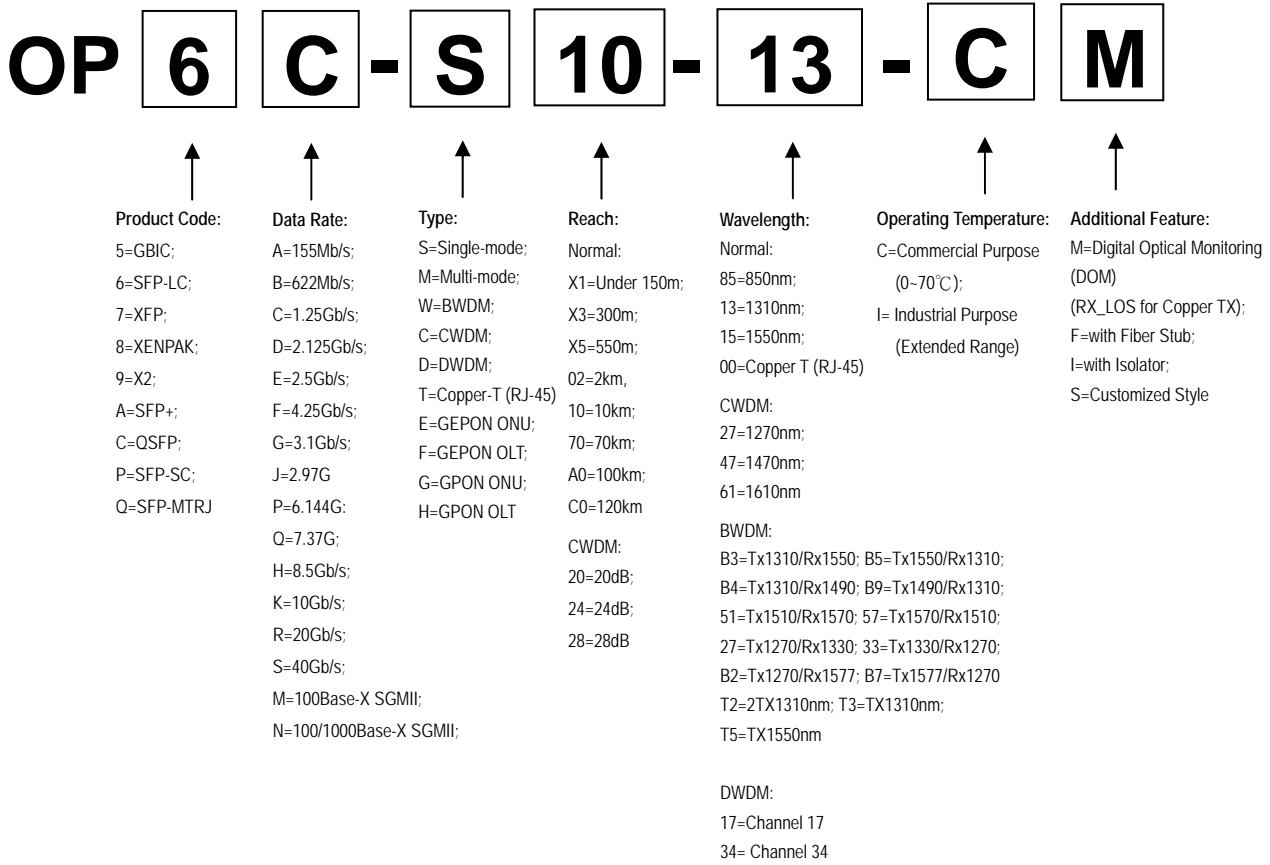

OP6C-TX1-00-C2 Provides 128 byte EEPROM, which can be accessed via the 2-wire serial communication protocol per SFP MSA with a device address of 0xA0.
